

# ESTPLY PLYWOOD STORING INSTRUCTIONS

Check the packs from outside already during unloading. If you notice any broken packing or transport damage, please take photos and let the supplier know.

Cover the stack to protect the top and edges from moisture penetration.

Plywood pallets shall be stored under a roof, and shall not be exposed to direct rain or sunshine.

Stack same size pallets on top of each other/together to avoid uneven pressure.

The plywood panels shall be stored horizontally in original packing. Stack panels on a stable base, with enough of bearers to prevent bending.

If film-faced formwork panels need to be stored temporarily outdoors, cover them with waterproof canvas. The panel edges should be protected from rain or ground water.

The suitable storing conditions of moisture and temperature shall be similar to those in which they are to be used.

Film-faced formwork panels are supplied by ESTPLY with moisture resistant paint on edges. In case of cutting the panels, make sure that you cover all edges thoroughly again to prevent moisture damages.

Increased moisture content and temperature variation may cause internal stresses, thickness swelling or surface defects.
